Identifying gene signatures in for diagnosis of abnormal cell reflects relative abundance of tissues 3'-directed human cDNA library - function, by preparing cDNA that corresp. mRNA in specific human

e.g.

Claim 1; Page 991-992; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue The appearance frequency of a given GS ir determined (esp. using primers and probes probes derived from the from which it was derived CDNA S ğ

> SSSSS Sequence 301 BP; 96 A; 65 C; 63 G; sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 66 T; 11 other
